Assignment 13

SHA-512

Theory:-

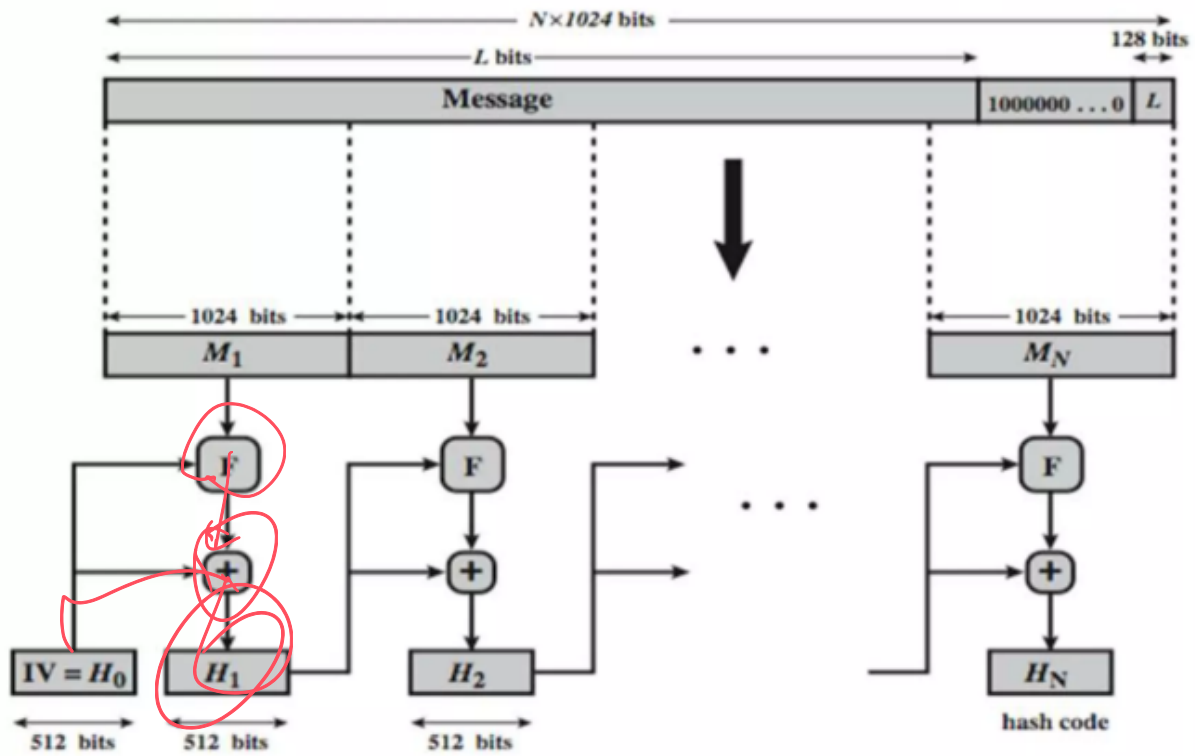

SHA-512 (Secure Hash Algorithm) is a set of cryptographic hash functions designed by the United States National Security Agency (NSA) and first published in 2001. They are built using the Merkle-Damgård construction, from a one-way compression function itself built using the Davies-Meyer structure from a specialised block cipher.

SHA-512 is a hashing algorithm that performs a hashing function on some data given to it.

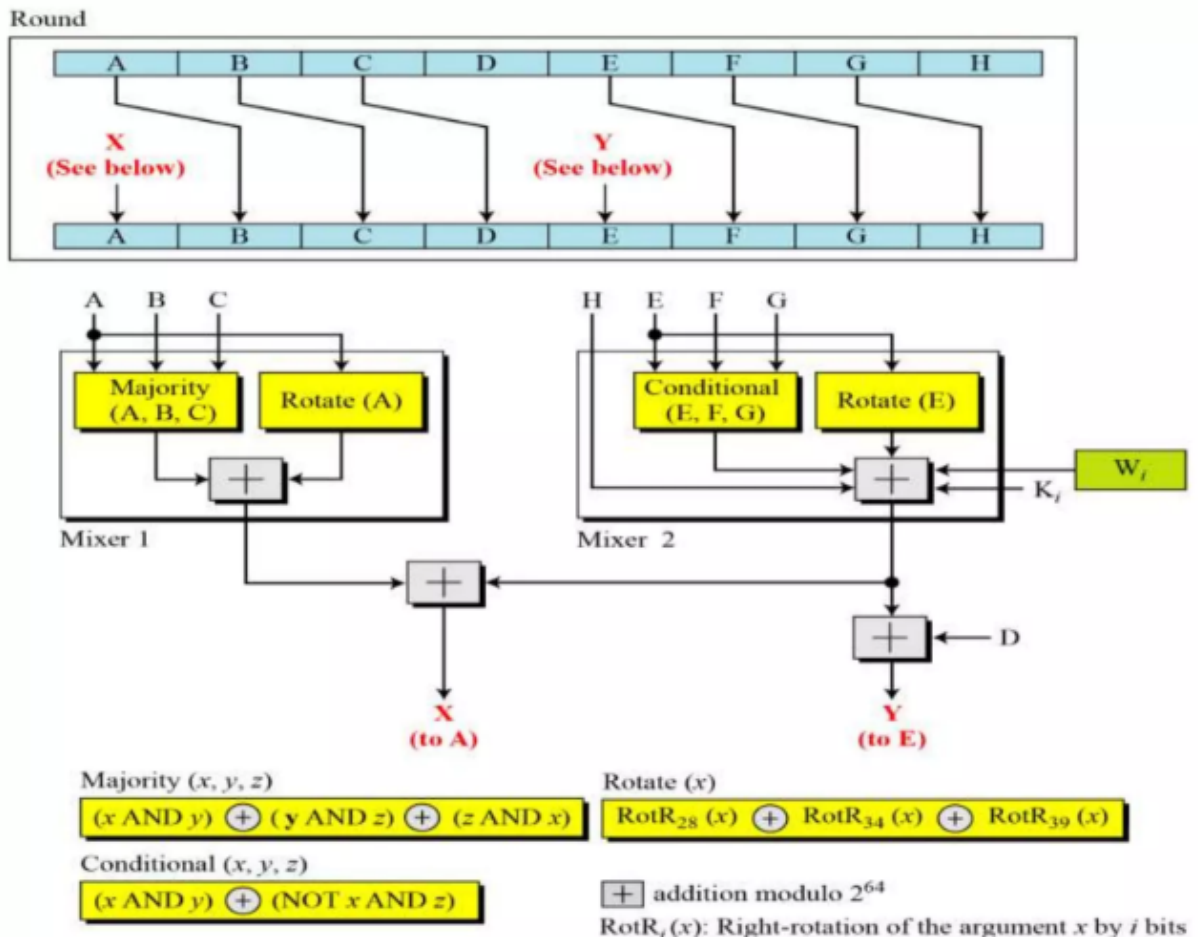

SHA-512

- 1) MD \rightarrow Merkle Damgård structure \rightarrow eg. SHA-512
- ① \rightarrow one way compression func
- ② \rightarrow make msg size, $N \times \text{block size}$ } for eg. SHA-512 1024 bits
- \rightarrow by appending length + padding (in which start with 1 followed by 0's)
- ③ 1024 bits

Processing of SHA-512

SHA-512 Round Function

Code:

```
#include<bits/stdc++.h>

#define ull unsigned long long

#define SHA_512_INPUT_REPRESENTATION_LENGTH 128
#define BLOCK_SIZE 1024

#define BUFFER_COUNT 8
#define WORD_LENGTH 64
#define ROUND_COUNT 80
```

```
using namespace std;
